

Introduction to Computing Module 3: Algorithms and Problem Solving

An algorithm is a step-by-step procedure for solving a problem or completing a task.

Computer programming involves writing algorithms that a computer can execute.

A variable is a named memory location used to store data that can change during program execution.

Hardware refers to the physical components of a computer system, such as the CPU and monitor.

Software is a set of instructions that tells a computer what tasks to perform.

Binary is a number system that uses only two digits, 0 and 1, to represent data.

The central processing unit, or CPU, is often called the brain of the computer.

A loop is a control structure that repeats a block of code while a condition remains true.
